Dalby Saleyards, Toogoolawah Saleyards and Beaudesert Saleyards.

The BUNYA Droughtmaster Bull Advantage

More Calves. Less Mustering. Better Bottom Line.

The BUNYA Droughtmaster Bull Advantage vs. European & British Breeds

Feature	BUNYA Droughtmaster Bull	Typical European or British Breed Bull
Parasite Management	High natural resistance. Sleek coats and sebum secretion naturally repel ticks and buffalo flies.	Low resistance. Requires frequent chemical dipping, back-lining, or ear-tagging.
Mustering Frequency	Minimal. Animals stay clean, healthy, and on pasture longer without intervention.	High. Continuous yarding required for parasite treatment, especially in heavy fly seasons.
Labor & Fuel Costs	Low. Less time in the Toyota or on the bike means money saved on fuel and extra hands.	High. Increased labor and vehicle wear-and-tear just to maintain herd health.
Environmental Adaptation	Shrugs off the heat and thrives in tough, coastal, or paddock conditions.	Suffers from heat stress, losing condition and libido when the temperature spikes.

The Female Factory - The Droughtmaster Cow

The Ultimate Female Base: Fertile, Protective, Self-Sufficient

- **Exceptional Mothering Ability:** Droughtmaster cows are renowned for their protective instincts, easy calving, and high-quality milk supply, ensuring high weaning weights year after year.
- **High Fertility Under Pressure:** They hold their condition and rebreed faster in tough seasons, keeping your calving intervals tight.
- **Low-Maintenance Parasite Resistance:** Built-in resistance to ticks and buffalo flies means fewer chemical treatments, lower husbandry costs, and cows that spend their time grazing, not scratching.

Every hour you spend mustering for ticks and fly, is money walking out of your paddock.
By introducing a BUNYA Droughtmaster bull to your herd, you inject immediate parasite resistance into your next calf crop. Less chemical input, fewer days in the dust, and more dollars in your pocket.
